# ELE 548 Mid Term Test, October 1997 Mark $=10$, Time $=50$ Minutes 

Q1-Consider two different machines M1 and M2 using same instruction set. There are four classes of instructions (A, B, C and D) for this instruction set.

M1 has clock rate of 50 MHz and the following CPI:
$\mathrm{A}=1, \mathrm{~B}=2, \mathrm{C}=3$ and $\mathrm{D}=4$.
M2 has a clock rate of 75 MHz . and the following CPI:
$\mathrm{A}=2, \mathrm{~B}=2, \mathrm{C}=4, \mathrm{D}=4$

- If the number of instructions executed in both machines are equally divided among classes, find which machine is faster.
- If M1 uses a hardware feature for class D that improve the performance of the above program by $20 \%$, find the amount of improvement to class D.

Q2- Consider the following C code:
for ( $\mathrm{i}=0 ; \mathrm{i}<j ; i++$ )
save $[\mathrm{i}]=\mathrm{k}$;
Assume that save is an array of words starts at address 1000. Registers $\$ 15, \$ 16, \$ 17$ are used for $\mathrm{i}, \mathrm{j}$ and k and $\$ 4=4, \$ 1=1$.

- Write the above code using MIPS instructions.
- Calculate the time to execute the above code and average MIPS in a 100 MHz MIPS processor if the cost of arthematic and logic instructions $=1$ cycle, data transfer instructions=4 cycles and control flow instructions $=2$ cycles.
- Find the performance improvement if a cache is used to reduce cost of data transfer from 4 cycles to 1 cycle.
