

Burying the Lines of Communication: Researcher Develops Underground Wireless Communication for Mines

27-Jul-2010 12:50 PM EDT | Ryerson University | ★ Add to Favorites |

Newswise — In recent years, the tragic story of mine accidents has been retold many times in international headlines. But thanks to the work of Ryerson University researcher Xavier Fernando, countless miners' lives could be saved in the future with state-of-the-art technology that makes wireless communication possible deep within the Earth's crust.

Dr. Fernando, a professor in Ryerson's Department of Electrical and Computer Engineering, is designing and developing highly reliable underground wireless communication systems that will ensure miners' safety before and after disasters.

"Ever since the United States passed the MINER (Mine Improvement and New Emergency Response) Act of 2006 (the country's most significant mine safety legislation in 30 years), there has been much more interest in the area of underground communications," said Dr. Fernando. "The mining industry is excited; it has been looking for better and more reliable forms of communication."

In the harsh environment and changing topology of a mine, reliable communication is a high-stakes issue. While cell phones have become the default means of communication in the mainstream, since their base stations are located aboveground, they are unfortunately useless underground. In addition, disasters can bring down electricity and communications cables, block tunnels and cause fires – all of which may hamper rescue efforts and endanger lives.

In response to these challenges, Professor Fernando is making use of an innovative technology to provide communications coverage for confined spaces such as mines and tunnels. His solution to bringing signals underground is transmitting radio signals over optical fibres. This technology, called ROF for short, provides enough bandwidth to handle and maintain signals underground. What's more, optical fibres are readily available and are unaffected by the electromagnetic interference or radiation commonly emitted by mining equipment.

ROF is already used to provide wireless-communication access to the \$985-million Niagara Tunnel, a massive hydroelectricity project sponsored by Ontario Power Generation. ROF also played a significant role in the 2000 Summer Olympics in Sydney, Australia. The wireless network there was able to support 500,000 phone calls during the Opening Ceremonies.

In the mining industry, ROF technology can also help officials identify miners and continuously track their movements. Therefore, in the event of a collapse, it would be easier to predict where each miner is located.

While ROF technology offers many solutions, it also presents a problem: since fibre-optic communication lines are not linear, signals can be scattered, creating distortion at the receivers. However, Dr. Fernando has created and holds a patent for an algorithm that almost entirely compensates for the distortion.

Partnering with Mine Radio Systems (MRS) of Goodwood, Ontario, the potential applications for the professor's work are myriad – there are numerous mining and tunnelling projects underway around the world, and each one of them requires high-tech communication systems.

To the same end, Dr. Fernando is also investigating a system of "Through-the-Earth" (TTE) signalling. Unlike higher-frequency communications, the ultra-low frequencies used in TTE technology (approximately 10 kilohertz) can penetrate water and rock. This capability would be invaluable to the mining industry as well, said Fernando.

"With this technology, officials could still maintain communication with a miner who is trapped and is likely covered by dirt and rocks." Ryerson University is Canada's leader in innovative, career-oriented education and a university clearly on the move. With a mission to serve societal need, and a long-standing commitment to engaging its community, Ryerson offers close to 100 undergraduate and graduate programs. Distinctly urban, culturally diverse and inclusive, the university is home to 28,000 students, including 2,000 master's and PhD students, nearly 2,700 tenured and tenure-track faculty and staff, and more than 130,000 alumni worldwide. Research at Ryerson is on a trajectory of success and growth: externally funded research has doubled in the past four years. The G. Raymond Chang School of Continuing Education is Canada's leading provider of university-based adult education. For more information, visit www.ryerson.ca.
